

Project : Complaint Management System

1. Header Alignment

- **Requirement:** Center-align the text "grievancehub complaint management" on the page.
- **Technical Task:** Update the CSS styling for the header element using text-align: center; or utilize flexbox properties (justify-content: center;) on its parent container.

2. Remove "Remember Me"

- **Requirement:** Delete the "Remember me" option completely.
- **Technical Task:** Remove the checkbox input element and its associated text label from the login form HTML.

3. Forgot Password Functionality

- **Requirement:** When a user clicks "Forgot password", display a message directing them to contact the administrator, including the administrator's specific name.
- **Technical Task:** Bind a click event listener to the "Forgot Password" link to trigger a modal, alert, or dynamic text insertion displaying: *"Please contact the Admin [Insert Admin Name] to reset your password."*

4. Remove Registration Link

- **Requirement:** Delete the "Don't have an account? Sign up" text and link.
- **Technical Task:** Remove the entire anchor tag and descriptive text container for user registration from the bottom of the login form.

Employee screens:

1. UI Navigation & Component Failures

- **Notification Component Breakdown:** The click event handler on the notification icon is completely unresponsive and fails to trigger its assigned function.
- **Search Icon Application Crash:** Clicking the search icon causes a critical runtime error, resulting in a blank "white screen" (likely due to an unhandled exception or an unconfigured route crashing the React error boundary).

2. Dashboard Analytics & Data Discrepancies

- **Metric Cards Misalignment:** The summary metric card for "Open" complaints displays a value of 0, completely failing to reflect the actual database status where two active open complaints exist.
- **Data Consistency Audit:** The remaining metric tracking cards—specifically **In Progress** and **Resolved** statuses—must also be verified to ensure they are syncing properly with the backend data sources.
- **Resolution Analytics Bug:** The "Resolution by Department" chart displays incorrect data analytics. While the bottom indicator accurately registers that 2 complaints were raised this month, the visual breakdown module plots an invalid resolution metric.
- **Status Breakdown Out of Sync:** The status distribution lifecycle graph shows 0 for open items and fails to fetch or render the correct real-time counts for **In Progress**, **Resolved**, and **Closed** states.

3. Recent Complaints Section & UI Optimization

- **Data Truncation Error:** The "Recent Complaints" component claims to fetch the latest 5 complaints across all departments, but its data array only maps and renders 2 entries. This data pipeline requires correction to fully display all 5 records.
 - **String Formatting Optimization:** The unique identifier (ID) string length is excessively long, cluttering the UI layout. Implement string truncation to limit the displayed ID value to a **maximum of 5 characters** for enhanced scannability.
-

1. Filtering & Search Mechanism Failures

- **Search Component Application Crash:** Executing a search query or interacting with the filter fields (Search by Title, Department, or ID) triggers a critical runtime exception, crashing the UI and resulting in a blank "white screen."
- **Status Filter Functional Failure:** Selecting any of the four options within the "All Statuses" dropdown filter menu fails to bind or filter the UI data grid below.
- **Priority Filter Functional Failure:** Selecting a value within the "All Priorities" dropdown filter container is completely unresponsive and does not filter the bottom table records.
- **Feature Removal:** The "Clear Fields" configuration or button needs to be completely removed from the user interface layout.

2. Department Data & Schema Mismatch

- **Data Entry and Filter Inconsistency:** The global "All Departments" dropdown filter queries short-form values like IT and Finance. However, the complaint submission engine maps and saves data using the full-form strings Information Technology and Human Resource. Because of this database string schema mismatch, selecting items from the department filter yields zero matching records.

3. UI Inconsistencies & Data Grid Styling

- **Identifier Visual Discrepancy:** The layout presentation and string formatting for the Unique Identifier (ID) column on this specific page do not match the UI design patterns used on the main dashboard screen. These components must be unified.
- **Status Tag Design Misalignment:** The "Open" and "In Progress" badge indicators are rendered using entirely different markup styles, shapes, or paddings. They must share an identical structural UI design token and typography layout, while keeping their distinct color-coded differences (e.g., green for Open, orange for In Progress) to preserve clear visual hierarchy.

The screenshot displays the 'ComplaintHub Employee Portal' interface. The main content area is titled 'Raise' and contains a 'New Complaint' form. The form has a subtitle 'Fill in the details below. Fields marked * are required.' and includes the following fields:

- Complaint Title ***: A text input field with the placeholder 'Brief summary of the issue'.
- Department ***: A dropdown menu with the placeholder 'Select department'.
- Priority ***: A dropdown menu with the placeholder 'Select priority'.
- Description ***: A text area with the placeholder 'Describe the issue in detail...'.
- Location / Floor**: A text input field with the placeholder 'e.g. 3rd floor, Block B'.
- Date of Incident**: A date input field with the placeholder 'dd-mm-yyyy'.

Below the form, there is a note: 'Optional — helps faster resolution.' and two buttons: 'Submit Complaint' and 'Clear'.

The sidebar on the left contains the following navigation links:

- Dashboard
- My Complaints
- Raise Complaint** (active)
- Resolution Tracking
- Settings

The top bar shows the 'Raise' title and a 'New Complaint' button. The bottom bar shows the user 'EU Human Resources'.

1. Header & Text Realignment

- **Top Bar Title Refinement:** The shorthand page identifier text "Raise" in the top navigation header bar should be renamed to "Raise Complaint" to match the sidebar navigation naming convention.
- **Form Subtitle Misalignment:** The form header subtext ("*New Complaint - Fill in the details below. Fields marked * are required.*") is off-center. Its CSS rules must be updated to ensure accurate horizontal center alignment.
- **Field Label Realignment:** The structural layout of the form field labels (*Complaint Title, Department, Priority, Description, Location / Floor, and Date of Incident*) is currently inconsistent. All labels must be explicitly left-aligned with their respective input elements to establish a clean, predictable visual hierarchy.

2. Field Schema Standardization & Feature Upgrades

- **Dynamic Title Selection:** The current free-form text input for **Complaint Title** should be converted into a structured selection dropdown or auto-suggest combobox pre-populated with a standardized array of the 10 most common corporate grievance types (e.g., *IT Hardware Failure, Software License Issues, Workplace Safety, Policy Clarifications, Facilities Maintenance, Billing Discrepancies, HR Inquiries, Access Control/ID Badges, Procurement Requests, and General Infrastructure Maintenance*).
- **Global Schema Inconsistency:** The dropdown lookup values for **Department** vary across different modules of the application (e.g., mixing short-form IT with long-form Information Technology). A single, uniform department data array must be defined globally and mapped identically across the submission form, metrics dashboard, and search filter modules.

3. Functional Form Errors

- **Component Application Crash:** The **Location / Floor** text input field is completely broken. Interacting with or typing inside this text element causes an unhandled component exception, triggering a total UI crash resulting in a blank "white screen."

1. Data Scope Restructuring (Personal Data Isolation)

- **User-Specific Query Filter:** Modify the data pipeline fetching records for this view. Instead of loading global system-wide complaints, implement a client or server-side filter to **render only the active user's submitted grievances** based on their authenticated session ID.

2. UI Layout overhaul & Feature Enhancement

- **Integrated Modern Analytics:** Introduce a dedicated, clean analytical module directly on this page to let users track their personal data trends.
 - *Option A (Tracking Timeline Chart):* A modern, horizontal **linear progress stepper** or **milestone timeline graph** displaying the direct journey of a selected complaint from *Submitted* → *Under Review* → *In Progress* → *Resolved*.
 - *Option B (Visual Status Distribution):* A sleek, minimalist **doughnut chart** or dynamic **mini-bar layout** highlighting the breakdown of the user's specific items across the lifecycle.

3. Data Grid & Schema Redesign

- **Column Structure Reconfiguration:** Clean up and standardize the primary data table columns to display exactly these five critical tracking data points:
 1. **Complaint ID:** A clearly formatted unique reference code.
 2. **Department:** The assigned target sector (using the standardized schema name).
 3. **Status:** The current active phase (Open, In Progress, Resolved) using consistent typography tokens.
 4. **Priority:** The assigned urgency matrix indicator (High, Medium, Low).
 5. **Date of Submission:** Clear calendar timestamp data formatting.
-

The screenshot shows the 'Settings' page of the 'ComplaintHub Employee Portal'. The left sidebar contains a 'MAIN' menu with links to Dashboard, My Complaints, Raise Complaint, Resolution Tracking, and Settings (which is highlighted). The user profile at the bottom left shows 'EU' and 'User Human Resources'. The main content area is titled 'Settings' and includes a '+ New Complaint' button. It features two sections: 'Profile Settings' and 'Notification Preferences'. In 'Profile Settings', the 'Full Name' field contains 'Arjun Kumar', the 'Email Address' field contains 'arjun.kumar@company.com', the 'Department' dropdown is set to 'HR', and the 'Role' dropdown is set to 'Employee'. A 'Save Changes' button is at the bottom. The 'Notification Preferences' section has four checkboxes: 'Email on complaint assignment' (checked), 'Email on status change' (checked), 'Daily digest of open complaints' (unchecked), and 'SLA breach alerts' (checked). A 'Save Preferences' button is at the bottom of this section. The browser's address bar shows 'localhost:5173/employee-dashboard'.

This screenshot shows the same 'Settings' page, but with the 'Change Password' section visible below the 'Notification Preferences'. The 'Notification Preferences' section remains the same, with the 'Save Preferences' button highlighted. The 'Change Password' section contains three input fields: 'Current Password', 'New Password', and 'Confirm Password', each masked with dots. An 'Update Password' button is located at the bottom of this section. The browser's address bar and the bottom status bar (showing 11:02 PM on 01-07-2026) are also visible.

1. Form Layout Alignment

- Field Label Realignment:** The input labels inside the Profile Settings block (*Full Name, Email Address, Department, and Role*) must be consistently left-aligned with their respective input containers to ensure clean readability and standard form design patterns.

2. Access Control & Input Mutation Restrictions

- **Editable Data Boundaries:** Limit user write privileges within the profile form layout. Only the **Full Name** and **Department** entry fields should accept mutations and remain editable by the user.
- **Immutable Read-Only Data fields:** Lock down critical account identifiers once a user session is authenticated. Convert the **Email Address** and **Role** input blocks into standard read-only or disabled text layouts so they cannot be altered via the client-side UI.
- **Form Submission Pipeline Bug:** The "**Save Changes**" action button is currently non-functional. The form submission handler needs to be implemented to correctly bind input data and fire a PUT/PATCH API request to commit updates to the user database record.

3. Component Deprecation & Feature Replacement Strategy

- **Layout Simplification:** Completely deprecate and remove the **Notification Preferences** configuration section from the interface layout. Do not implement a "Change Password" block.
- **Targeted Corporate Project Feature Additions:** To replace the removed sections with high-value modules tailored specifically to a corporate grievance platform, consider implementing one of the following production-ready features:
 - **Option A (Active Delegation / Escalation Matrix):** A dedicated read-only layout block displaying the user's assigned organizational management chain (e.g., *Your Reporting Manager, Department Grievance Head, and HR Ombudsperson*). This helps users identify exactly who reviews their raised tickets.
 - **Option B (Linked Corporate Devices / Workspace Node):** A small asset information section mapping the user's current corporate hardware assignment (e.g., *Laptop Serial ID, Assigned Cubicle/Floor Node, and Primary IP/Network Block*) to speed up IT-related grievance auto-routing.
 - **Option C (Account Activity Auditing log):** A clean tabular timeline log showing recent security milestones for the account (e.g., *Last Login Timestamp, Login Device Browser footprint, and Count of Active Raised Tickets*).

Admin screens :

1. Dashboard Metrics Analytics Sync (Data Pipeline Correction)

- **Total Grievances Counter Alignment:** The "Total Grievances" analytical summary block currently displays a static value of 4 with a hardcoded +12 this month subtext. This pipeline needs to be dynamic, matching actual database records rather than relying on placeholder assets.
- **Metric Cards Data Discrepancy:** The analytics containers tracking active lifecycle metrics show inaccurate tallies:
 - **Open:** Displays 0 despite active, unassigned items existing within the system database core.
 - **In Progress:** Displays 0, failing to track ongoing investigation milestones.
 - **Resolved:** Displays 0 with a misleading 87% SLA met indicator that does not represent real-time performance.
- **Status Breakdown Graph Failure:** The donut chart distribution system registers a total value of 4 items in its central node, but outputs an empty 0 count layout next to all structural legend tokens (**Open, In Progress, Resolved, Closed**). This charting state logic requires comprehensive correction.

2. Resolution Analytics Schema Alignment

- **Horizontal Graph Label Correction:** The "Resolution by Department" progress tracking component queries shorthand dataset categories like IT, Finance, Facilities, Admin, and Security.

- Database Schema Mapping:** This dataset must be rewritten to match the comprehensive corporate schema fields utilized by the submission platform (e.g., converting shorthand keys to full database strings like Information Technology and Human Resources) to ensure analytics pull true metric values.

3. Recent Grievances Component Refinement

- Data Limit Enforcement:** The bottom summary block title states it displays the *Latest 5 complaints across all departments*. However, the mapping loop currently loads zero visible records. Fix this backend fetch controller to slice and deliver exactly the 5 most recent array elements.
- Unique Reference Truncation:** Update the data grid logic within this component to enforce string length limits on the primary key values. Crop long, raw tracking alphanumeric IDs to a **maximum display boundary of 5 characters** to optimize vertical alignment and screen layout space.

Change I already said in the employee screen-My complaints plus

1. Data Inconsistency & Badge Sync

- Sidebar Notification Badge Fix:** The numerical indicator next to the "All Grievances" sidebar link currently displays a static value of 12. This hardcoded asset must be replaced with a dynamic calculation (`data.length`) that accurately matches the database records. Based on the data grid layout, it must show exactly 6.

2. Table Column Schema Alignment

- **Data Grid Re-ordering:** Restructure the primary data table headers and their corresponding row values to reflect the exact requested layout order:
 1. **ID**
 2. **Department**
 3. **Title**
 4. **Priority**
 5. **Status**
 6. **Assignee**
 7. **Date**

3. Interactive Grievance Assignment Modal (UX/UI Feature Request)

- **Row Click Event Handler:** Bind an interactive onClick click event listener to each table row. Clicking any specific grievance entry must trigger a clean, animated overlay modal instead of routing away from the page.
 - **Modal Information Architecture:** The pop-up container must dynamically pull and render the comprehensive complaint registration parameters collected during submission. Display these read-only details inside a structured, multi-column grid view:
 - *Grievance Header:* Title, ID, and Submission Date.
 - *Categorization:* Department and Urgency Priority.
 - *Core Context:* Deep-dive Description text block and Location/Floor details.
 - **Assignment Controls:** Positioned directly below the complaint data summary, implement an intuitive **"Assign To"** module. This configuration must feature:
 - A searchable, pre-populated dropdown combobox to seamlessly select an available administrator or support agent.
 - A primary **"Assign"** button with a distinct corporate theme color (e.g., matching your dashboard's deep violet/purple theme) to fire the PUT mutation API request.
 - An adjacent secondary **"Cancel"** button styled with an outlined or subtle slate-grey theme to safely dismiss the modal layer without committing mutations.
-

1. Form Layout Alignment & Visual Flow

- **Field Label Realignment:** The labels above the selection fields (*Select Grievance*, *Assign To*, and *Update Status*) are currently centered or misaligned relative to their dropdown inputs. Update the CSS rules to ensure all layout titles are **strictly left-aligned** with their corresponding field containers to create a clean, modern form flow.
- **Grid Sizing Balance:** The "Select Grievance" field is currently stretching full-width alone on the top row, creating an uneven visual weight. Reconfigure the grid structure so it mirrors the layout pattern of the row beneath it.

2. Mock Data Array Expansion (Pagination / Data Limits)

- **Grievance Dataset Expansion:** Expand the mock data array or backend fetch limit for unassigned complaints to simulate production data. Populate this dropdown configuration with exactly **10 distinct corporate grievance options** (e.g., *Network Outage*, *Software License Renewal*, *Facilities Maintenance*, *Workplace Safety Incident*, *Payroll Discrepancy*).
- **Staff Roster Expansion:** Expand the internal personnel lookup array assigned to the "Assign To" selection module. Ensure it maps out exactly **10 distinct support staff profiles** across departments, complete with clear names and unique employee identifiers, to test high-density dropdown sorting.

3. Functional Notification Error

- **Email Pipeline Disconnection:** The "Notify via Email" button module is completely non-functional. The click action listener fails to bridge with an internal messaging agent or trigger an external email API utility. This component requires a dedicated event handler linked to an SMTP microservice or localized toast alert notifying successful dispatch.

1. Advanced Analytical Dashboard Integration (Modern UX/UI Refinement)

- **Data Grid Modern Overhaul:** Replace or augment the plain tabular structure with modern visual metrics and interactive data visualization components to elevate admin scannability.
- **High-to-Low Priority Urgency Chart (Urgent Request):** Implement a prominent, high-utility chart at the top of the interface—such as a **stacked horizontal bar chart** or an **ordered prioritization funnel matrix**—that maps complaints from *High* → *Medium* → *Low* priority. This will serve as a visual action cue for administrators to immediately isolate and accelerate bottlenecked, high-severity critical tickets.
- **Active Metric Cards Alignment:** Review the upper status metrics container (**Open: 3, In Progress: 1, Resolved: 0**). Ensure these numerical data tags are wired to change dynamically with the state changes of the priority funnel chart.

2. Global Department Schema Standardization

- **String Uniformity Enforcement:** Resolve the naming inconsistencies in the **Department** data layer. The application currently displays mixed naming models within the column grid (e.g., long-form *Information Technology* vs shorthand *IT*).
- **Database Normalization:** Standardize the backend response or client-side mapping layers to enforce a single formatting pattern across the entire application—either strictly using full-form strings (*Information Technology*, *Human Resources*, *Finance*, *Facilities*) or concise standardized acronyms (*IT*, *HR*, *FIN*, *FAC*).

1. Data Integrity & Real-Time Sync

- **Dynamic Summary Statistics Validation:** The analytics reporting modules inside the "Summary Statistics" grid display critical mathematical data conflicts that must be resolved with real-time database state synchronization:
 - **Total Raised vs. Breached SLA Paradox:** The component currently reflects a total of 5 grievances raised for the month, but paradoxically outputs 7 complaints under the "Breached SLA" marker. The data pipeline logic must be restructured so that subset conditions (like Breached SLA) never exceed the parent record tally.
 - **Live Average Resolution Calculations:** The **Avg. Days** (3.2) and **Resolved** (1) metric displays must be programmed to calculate

dynamically using true timestamp differentials rather than static placeholder values.

2. Layout & Typography Alignment

- **Field Label Realignment:** The configuration labels within the form container (*From Date, To Date, Department, and Status*) are currently centered or unevenly spaced above their respective control inputs. Update the layout CSS to ensure all these descriptive titles are **strictly left-aligned** with their input structures to establish architectural consistency with the rest of the application screens.

1. Form Layout Alignment

- **Field Label Realignment:** The configuration labels inside the Profile Settings block (*Full Name, Email Address, Department, and Role*) must be updated to be **strictly left-aligned** with their respective input boxes to establish layout symmetry and clean visual scanning.

2. Role-Based Access Control & Input Mutation Restrictions

- **Editable Administrative Fields:** Retain write permissions exclusively for the **Full Name** and **Department** selection dropdown fields, allowing administrators to modify their base profile info.

- **Immutable Core Account Markers:** Lock down authentication identifiers post-login. The **Email Address** field and the **Role** input (which explicitly displays Administrator instead of employee designations) must be converted into disabled or read-only elements to prevent accidental alterations.
- **API Form Submission Handler:** Implement the backend payload pipeline for the "Save Changes" action button to ensure form updates fire a clean network request to persist changed states in the database.

3. Component Deprecation & Feature Replacement Strategy

- **Layout Simplification:** Completely remove the **Notification Preferences** block from the user interface layout. Do not include a "Change Password" section.
 - **Admin-Centric Platform Additions:** To replace the removed elements with high-utility features tailored for an administrator, consider implementing one of the following production options:
 - **Option A (System Management Scope / Coverage Area):** A read-only informational block highlighting the admin's assigned operational scope (e.g., *Assigned Departments for Escalation, Global SLA Breach Authorization Levels, and Active Reporting Nodes*).
 - **Option B (Administrative Audit Trail Log):** A minimalist tracking grid displaying a timeline log of recent critical administrative actions executed by the account (e.g., *Last Ticket Assigned Timestamp, Last SLA Status Override, and Active Session Devices*).
-
